Simple Application Security

Les Hazlewood
Apache Shiro Project Chair
CTO, Stormpath

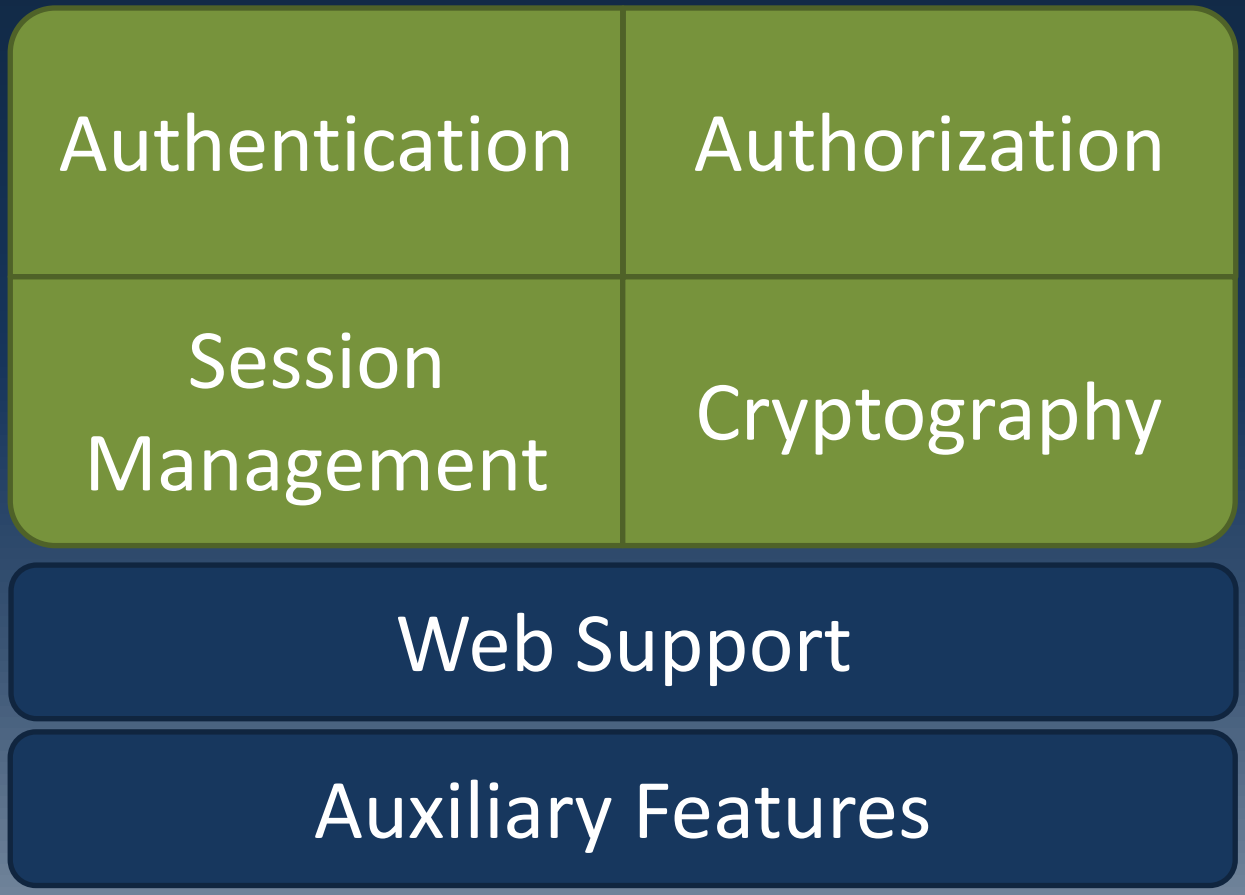
What is Apache Shiro?

- Application security framework
- ASF TLP - http://shiro.apache.org
- Quick and Easy
- Simplifies Security Concepts & Design

SHIRO

Stormpath

Agenda



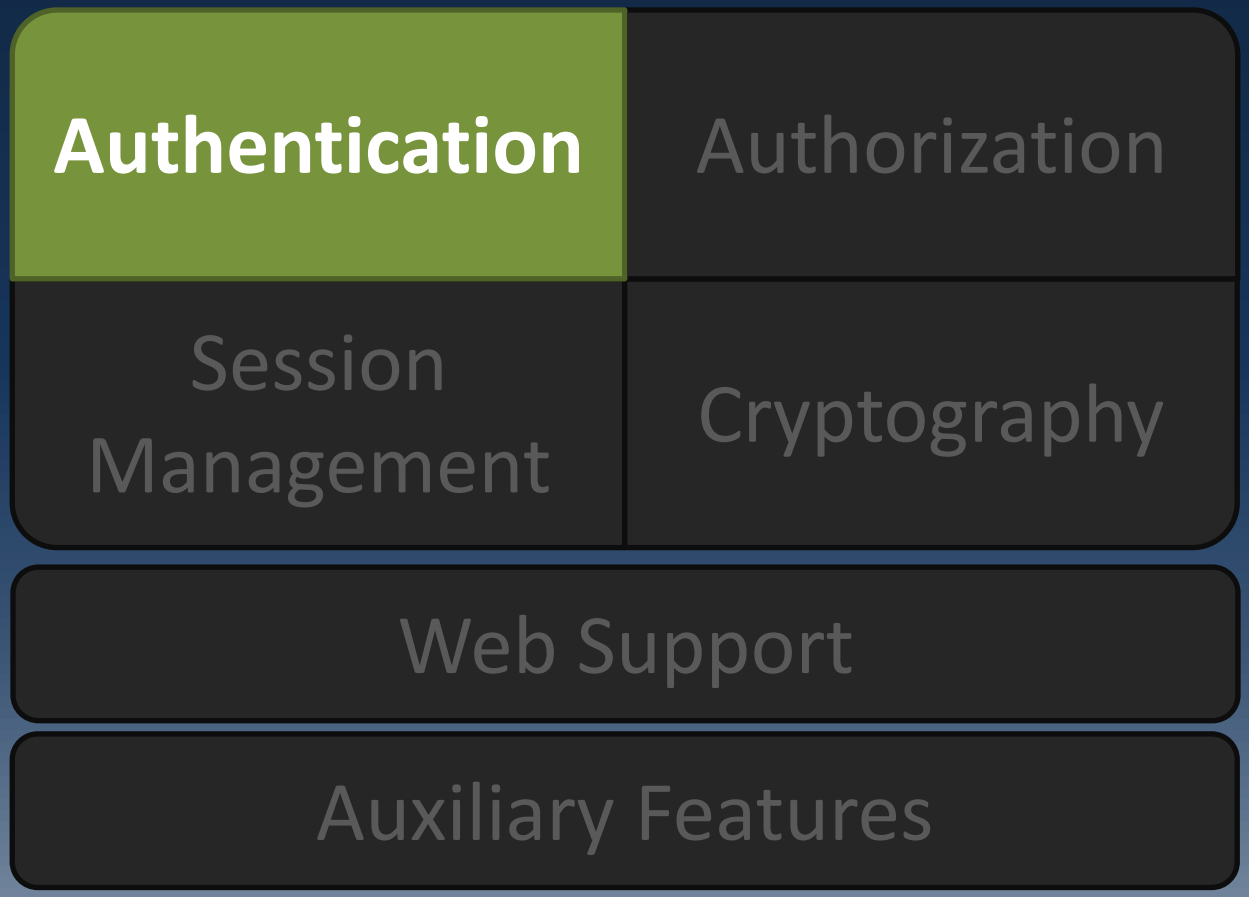
SHIRO

Stormpath

Quick Terminology

- **Subject** – Security-specific user ‘view’
- **Principals** – Subject’s identifying attributes
- **Credentials** – Secret values that verify identity
- **Realm** – Security-specific DAO

Authentication



SHIRO

Stormpath

Authentication Defined

Identity verification:

Proving a user is who he says he is

Shiro Authentication Features

- Subject-based (current user)
- Single method call
- Rich Exception Hierarchy
- ‘Remember Me’ built in
- Event listeners

How to Authenticate with Shiro

Steps

1. Collect principals & credentials
2. Submit to Authentication System
3. Allow, retry, or block access

Step 1: Collecting Principals & Credentials

```
UsernamePasswordToken token = new
  UsernamePasswordToken(username, password);

//”Remember Me” built-in:
token.setRememberMe(true);
```

Step 2: Submission

```
Subject currentUser =
   SecurityUtils.getSubject();

currentUser.login(token);
```

SHIRO

Stormpath

Step 3: Grant Access or Handle Failure

```
try {
currentUser.login(token);
} catch (UnknownAccountExceptionuae){ ...
} catch (IncorrectCredentialsException ice {
    ...
} catch ( LockedAccountExceptionlae ) { ...
} catch ( ExcessiveAttemptsExceptioneae ) { ...
} ... catch your own ...
} catch ( AuthenticationExceptionae ) {
    //unexpected error?
}
//No problems, show authenticated view…
```

SHIRO

Stormpath

How does it work?

Subject .login(token)

How does it work?

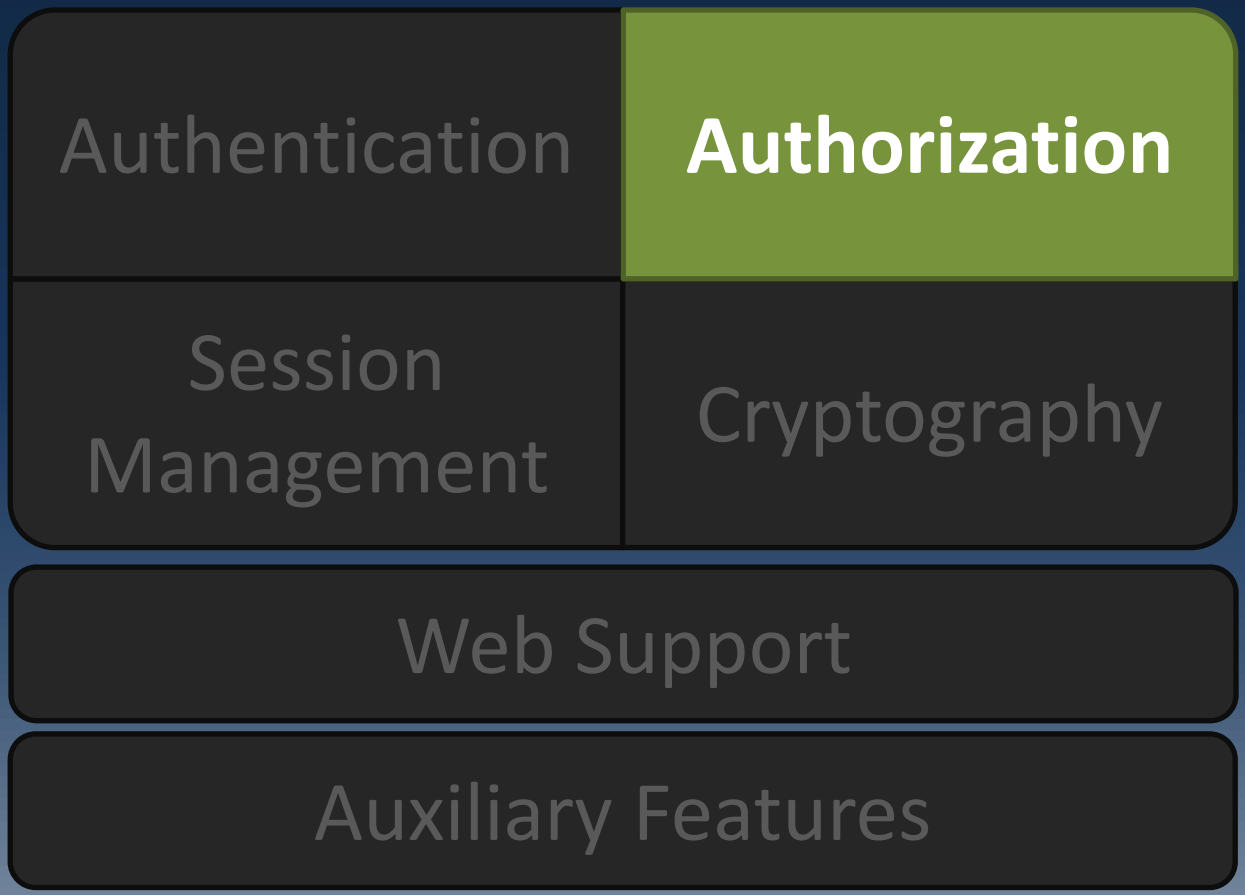
Authorization



SHIRO

Stormpath

Authorization Defined

Process of determining “who can do what”
AKA Access Control

Elements of Authorization

- Permissions
- Roles
- Users

Permissions Defined

- Most atomic security element
- Describes resource *types* and their behavior
- The “what” of an application
- Does not define “who”
- AKA “rights”

Roles Defined

- Implicit or Explicit construct
- Implicit: Name only
- Explicit: A named collection of Permissions

  Allows behavior aggregation

  Enables dynamic (runtime) alteration of user abilities.

Users Defined

- The “who” of the application

- What each user can do is defined by their association with Roles or Permissions

Example: User’s roles imply PrinterPermission

Authorization Features

- Subject-centric (current user)
- Checks based on roles or permissions
- Powerful out-of-the-box WildcardPermission
- Any data model – Realms decide

How to Authorize with Shiro

Multiple means of checking access control:

- Programmatically
- JDK 1.5 annotations & AOP
- JSP/GSP/JSF* TagLibs (web support)

Programmatic Authorization

Role Check

```
//get the current Subject
Subject currentUser=
SecurityUtils.getSubject();

if (currentUser.hasRole("administrator")) {
    //show the 'delete user' button
} else {
    //don't show the button?)
}
```

SHIRO

Stormpath

Programmatic Authorization

Permission Check

```
Subject currentUser=
SecurityUtils.getSubject();

Permission deleteUser=
new UserPermission(“jsmith”,“delete”);

If (currentUser.isPermitted(deleteUser)) {
    //show the ‘delete user’ button
} else {
//don’t show the button?
}
```

SHIRO

Stormpath

Programmatic Authorization

Permission Check (String-based)

```
String perm = "user:delete:jsmith";

if(currentUser.isPermitted(perm)){
//show the 'delete user' button
} else {
//don't show the button?
}
```

SHIRO

Stormpath

Annotation Authorization

Role Check

```
@RequiresRoles( “teller” )
public void openAccount(Account a) {
    //do something in here that
   //only a ‘teller’ should do
}
```

SHIRO

Stormpath

Annotation Authorization

Permission Check

```
@RequiresPermissions("account:create")
public void openAccount(Account a) {
    //create the account
}
```

SHIRO

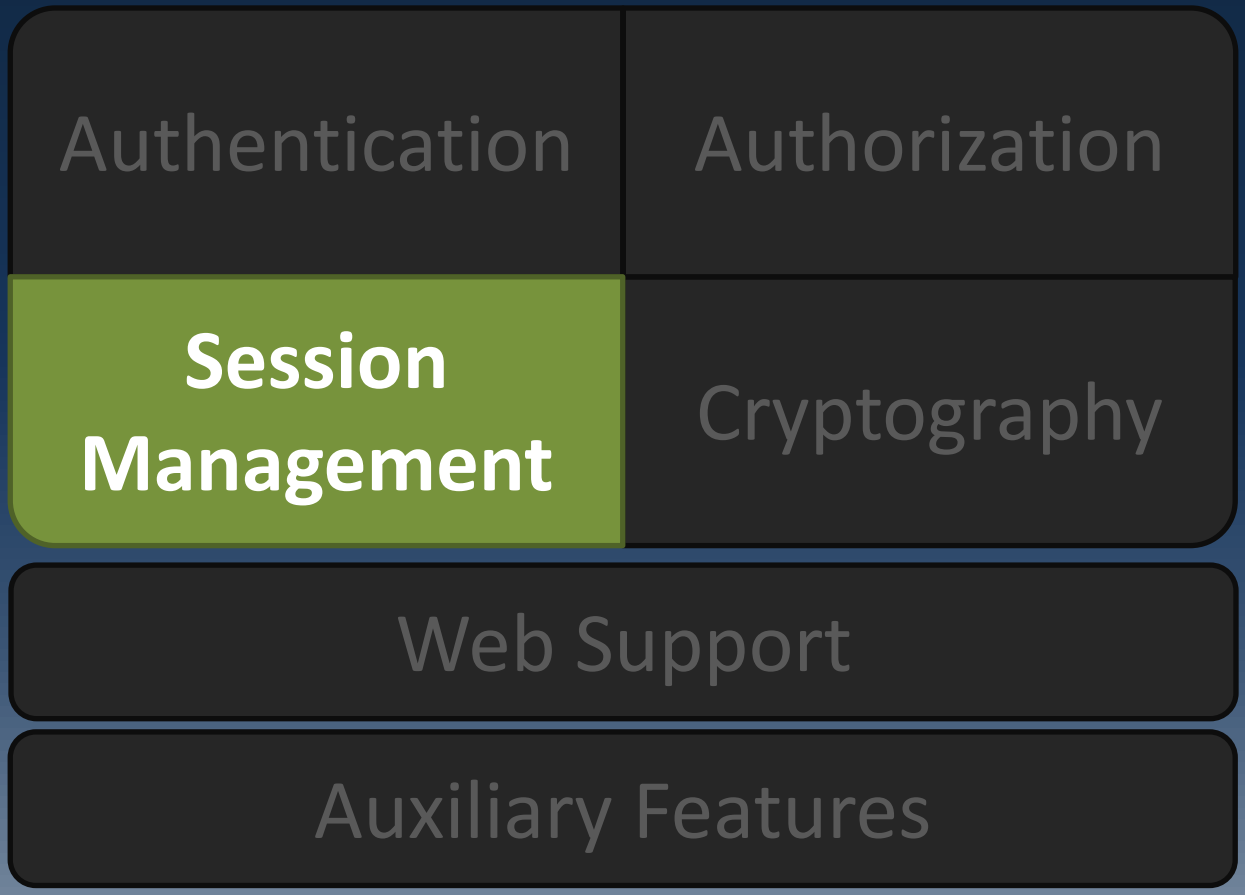
Enterprise Session Management



SHIRO

Stormpath

Session Management Defined

Managing the lifecycle of Subject-specific temporal data context

Session Management Features

- Heterogeneous client access
- POJO/J2SE based (IoC friendly)
- Event listeners
- Host address retention
- Inactivity/expiration support (touch())
- Transparent web use - HttpSession
- Container-Independent Clustering!

Acquiring and Creating Sessions

```
Subject currentUser =
SecurityUtils.getSubject()

//guarantee a session
Session session =
subject.getSession();

//get a session if it exists
subject.getSession(false);
```

Session API

```
getStartTimestamp()

getLastAccessTime()

getAttribute(key)

setAttribute(key, value)

get/setTimeout(long)

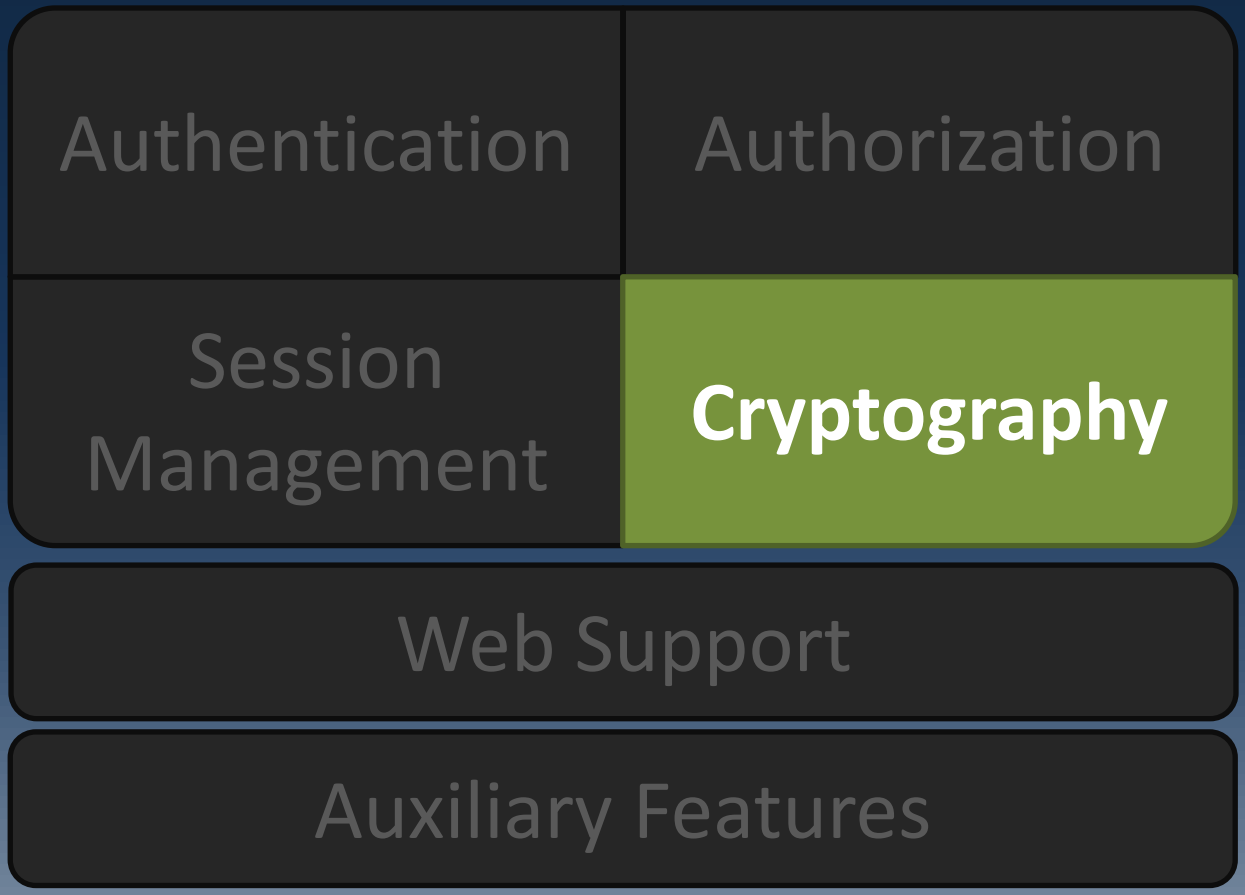
touch()

...
```

SHIRO

Stormpath

Cryptography



SHIRO

Stormpath

Cryptography Defined

Protecting information from undesired access by hiding it or converting it into nonsense.

Elements of Cryptography

- Ciphers
- Hashes

Ciphers Defined

Encryption and decryption data based on shared or public/private keys.

- **Symmetric Cipher –** same key
  - Block Cipher – chunks of bits
  - Stream Cipher – stream of bits
- **Asymmetric Cipher -** different keys

Hashes Defined

A one-way, irreversible conversion of an input source (a.k.a. Message Digest)

Used for:

- Credentials transformation, Checksum
- Data with underlying byte array

  Files, Streams, etc

Cryptography Features

Simplicity

- Interface-driven, POJO based
- Simplified wrapper over JCE infrastructure.
- “Object Orientifies” cryptography concepts
- Easier to understand API

Cipher Features

- OO Hierarchy

  JcaCipherService, AbstractSymmetricCipherService, DefaultBlockCipherService, etc

- Just instantiate a class

  No “Transformation String”/Factory methods

- More secure default settings than JDK!

  Cipher Modes, Initialization Vectors, et. al.

Example: Plaintext

Shiro'sCipherService Interface

```
public interface CipherService {

ByteSourceencrypt(byte[] raw,
      byte[] key);

   void encrypt(InputStream in,
OutputStreamout, byte[] key);

ByteSourcedecrypt( byte[] cipherText,
       byte[] key);

   void decrypt(InputStream in,
OutputStreamout, byte[] key);
}
```

SHIRO

Stormpath

Hash Features

- Default interface implementations

  MD5, SHA1, SHA-256, et. al.

- Built in Hex &Base64 conversion

- Built-in support for Salts and repeated hashing

Shiro's Hash Interface

```
public interface Hash {

    byte[] getBytes();

    String toHex();

    String toBase64();

}
```

Intuitive OO Hash API

```
//some examples:
new Md5Hash("foo").toHex();

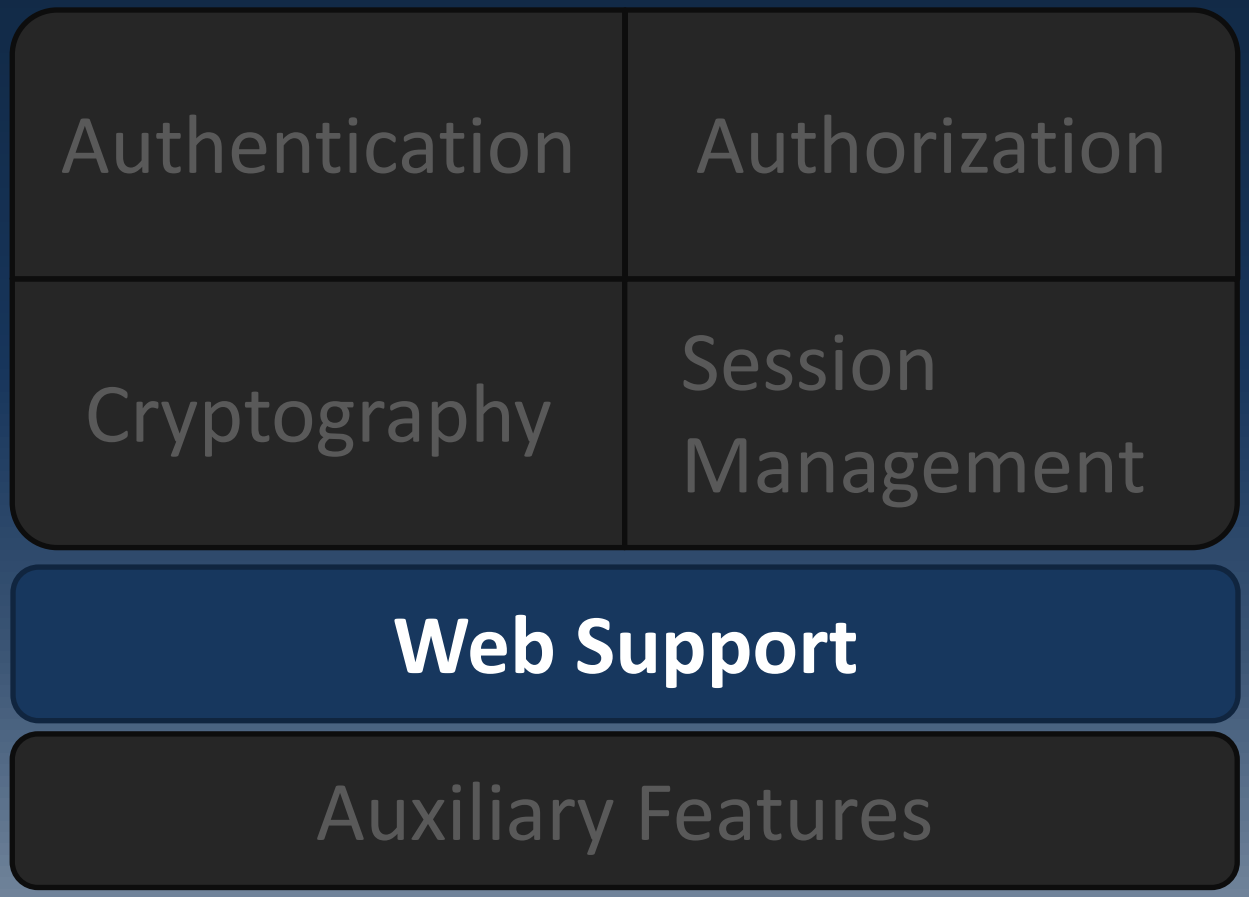
//File MD5 Hash value for checksum:
new Md5Hash( aFile ).toHex();

//store password, but not plaintext:
new Sha512(aPassword, salt,
1024).toBase64();
```

SHIRO

Stormpath

Web Support



SHIRO

Stormpath

Web Support Features

- Simple ShiroFilter web.xml definition
- Protects all URLs
- Innovative Filtering (URL-specific chains)
- JSP Tag support
- Transparent HttpSession support

web.xml

```
<filter>
<filter-name>ShiroFilter</filter-name>
<filter-class>
org.apache.shiro.web.servlet.IniShiroFilter
</filter-class>
</filter>

<filter-mapping>
<filter-name>ShiroFilter</filter-name>
<url-pattern>/*</url-pattern>
</filter-mapping>
```

SHIRO

Stormpath

shiro.ini

```
[main]
ldapRealm = org.apache.shiro.realm.ldap.JndiLdapRealm
ldapRealm.userDnTemplate = uid={0},ou=users,dc=mycompany,dc=com
ldapRealm.contextFactory.url = ldap://ldapHost:389

securityManager.realm= $realm

[urls]
/images/**  = anon
/account/** = authc
/rest/** = authcBasic
/remoting/** = authc, roles[b2bClient], …
```

SHIRO

Stormpath

JSP TagLib Authorization

```
<%@ taglib prefix="shiro"
uri="http://shiro.apache.org/tags" %>
<html>
<body>
<shiro:hasRole name="administrator">
<a href="manageUsers.jsp">
            Click here to manage users
</a>
</shiro:hasRole>
<shiro:lacksRole name="administrator">
        No user admin for you!
</shiro:hasRole>
</body>
</html>
```

SHIRO

Stormpath

JSP TagLibs

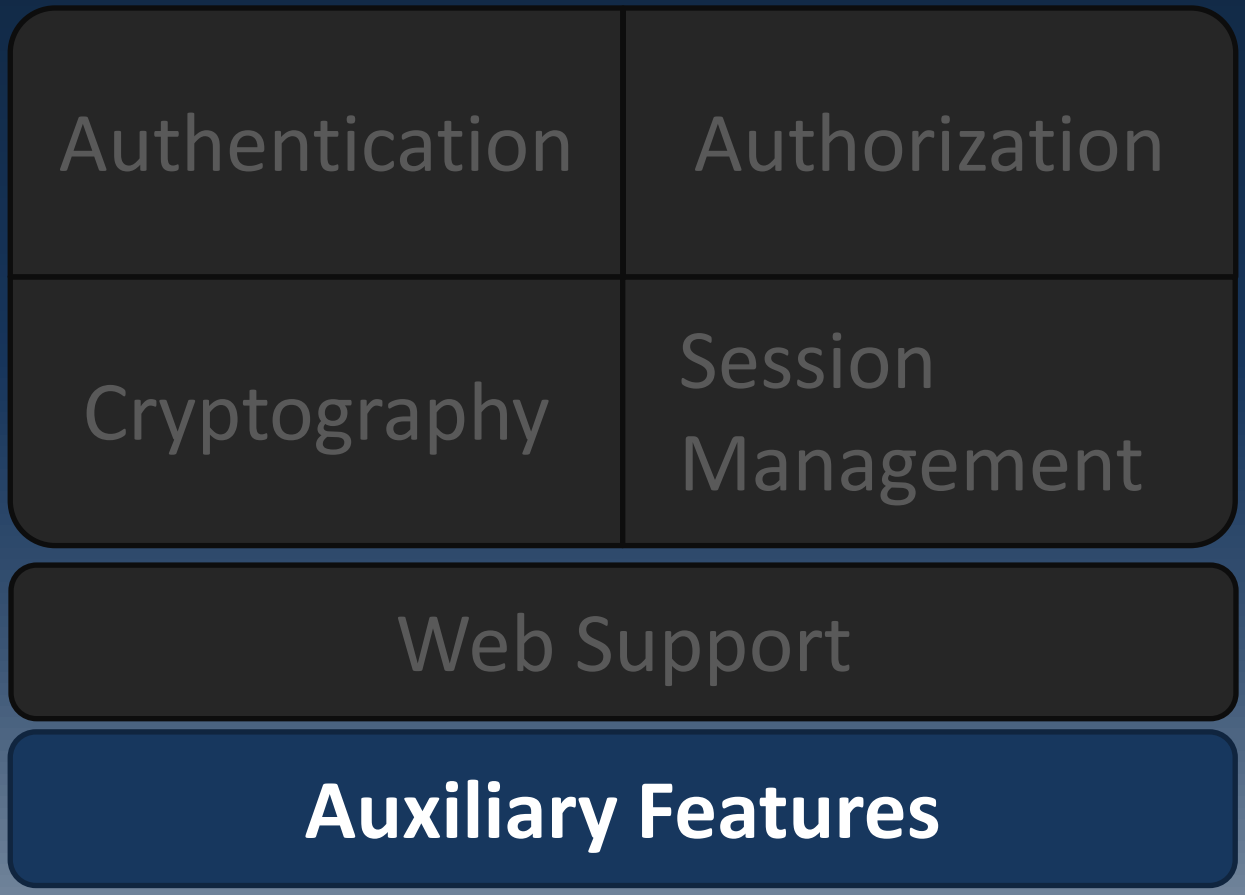
```
<%@ taglib prefix="shiro"
uri=http://shiro.apache.org/tags %>

<!-- Other tags: -->
<shiro:guest/>
<shiro:user/>
<shiro:principal/>
<shiro:hasRole/>
<shiro:lacksRole/>
<shiro:hasAnyRoles/>
<shiro:hasPermission/>
<shiro:lacksPermission/>
<shiro:authenticated/>
<shiro:notAuthenticated/>
```

SHIRO

Stormpath

Auxiliary Features



SHIRO

Stormpath

Auxiliary Features

- Threading & Concurrency

  Callable/Runnable & Executor/ExecutorService

- “Run As” support
- Ad-hoc Subject instance creation
- Unit Testing
- Remembered vs Authenticated

Logging Out

```
//Logs the user out, relinquishes account
//data, and invalidates any Session
SecurityUtils.getSubject().logout();
```

App-specific log-out logic:

- Before/After the call
- Listen for Authentication or StoppedSession events.

Stormpath:Application Security Service

Out-of-the-box Features

- Managed security data model
- Secure credential storage
- Flexible permissions
- Password self-service GUI
- Management GUI
